Wave Forecast System Operational Manual v1.0

Standard Operational Guidance for Ocean Wave & Swell Predictions

Generated: 8/22/2026 | Official Document

1. Executive Summary

This manual outlines the standard numerical modeling procedures for predicting sea surface boundary conditions, wave periods, and swell dynamics across coastal observing networks.

2. Operational Workflow

Data is ingested every 6 hours from sea level buoys and satellite altimetry. Boundary conditions are computed using hydrodynamic models and rendered to local forecasting centers.

3. Compliance & Safety

All forecasting analysts must verify wave height anomalies exceeding 2.5 meters and issue immediate coastal marine advisories.
